Steve Simon

This file was created on 2021-02-22 and last modified on 2021-02-22.

Note: this solution uses R and SQLite. An alternate solution using SAS and Oracle is also available.

Your homework

- Use the cigarettes table in the melange database. The variable weight_g is recorded to four decimal places. Round all the values to two decimal places and display them.

- Use the hospital table in the ehr database. The variable ACUTE_NONACUTE has the values Acute and Non-Acute. Use the substr function to convert these two values to the first letter (A or N). Print out the first ten values only.

- Use the patient_type table in the ehr database. List all the values of PAT_TYPE_DESC after converting the data to lower case.

Note: Some of the names used in this code are arbitrary and you can choose whatever names you want. To emphasize which names can be modified at your discretion, I am using names of famous statisticians.

The statistician being honored in this code is John Tukey.

```
library(sqldf)
```

```
## Loading required package: gsubfn
```

```
## Loading required package: proto
```

```
## Loading required package: RSQLite
```

```
tukey1 <- dbConnect(SQLite(),
  dbname="../data/melange.sqlite")

john1 <- dbGetQuery(conn=tukey1, "
    select
      weight_g, round(weight_g, 2) as rounded_weight
    from cigarettes
")

john1
```

```
